Welcome! This web site contains information related mostly to research being carried out in my laboratories at the University of California, Berkeley and at Lawrence Berkeley National Laboratory (LBNL). You will also find links to activities related to the Journal of the American Chemical Society or to work in nanoscience and nanotechnology at LBNL's Molecular Foundry. For graduate admissions, please follow the link to the College of Chemistry.

Our research is largely concerned with functional polymers, from fundamental studies to applications. The research is highly multidisciplinary at the interface of several fields including organic, polymer, biological, and materials chemistry. Chemical Engineering is also well represented with our research in energy-related materials and microfluidics.
